## Data

The data you will be using comes from the Assistments online intelligent tutoring system (<https://www.assistments.org/>). It describes students working through online math problems. Each student has the following data associated with them:

- id
- prior\_prob\_count: How many problems a student has answered in the system prior to this session
- prior\_percent\_correct: The percentage of problems a student has answered correctly prior to this session
- problems\_attempted: The number of problems the student has attempted in the current session
- mean\_correct: The average number of correct answers a student made on their first attempt at problems in the current session
- mean\_hint: The average number of hints a student asked for in the current session
- mean\_attempt: The average number of attempts a student took to answer a problem in the current session
- mean\_confidence: The average confidence each student has in their ability to answer the problems in the current session

```
D1 <- read.csv("~/Desktop/master fall/hudk4050/assignment4/Assistments-confidence.csv")
D1 <- select(D1,-id)

Create a correlation matrix of the relationships between the variables, including correlation coefficients for each pair of variables/features.

*#You can install the corrplot package to plot some pretty correlation matrices (sometimes called correlograms)*

```
library(corrplot)
```

```

*#Study your correlogram image and save it, you will need it later*

Create a new data frame with the mean\_correct variables removed

```
D2 <- select(D1, -mean_correct)

#The, scale and center your data for easier interpretation
D2 <- scale(D2, center = TRUE)
```

Now run the PCA on the new data frame
